

The editor contains three pages.

- 1 Home
- 2 Navigate
- 3 The Editor

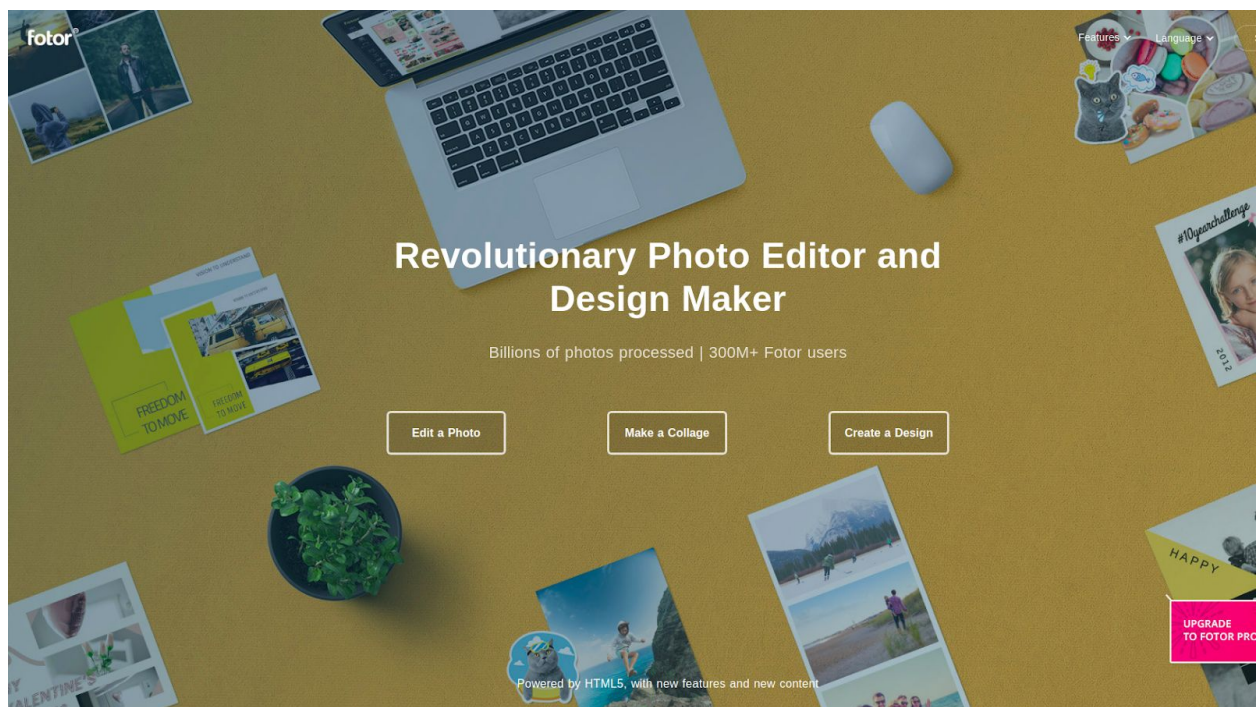

Home page

The home page would be a simple layout, consisting of two layers,

1 First layer - This layer will contain details about the editor like what is a crop, what does one mean by the brightness level of the image, and much more.

2 Second layer - This will contain two options,

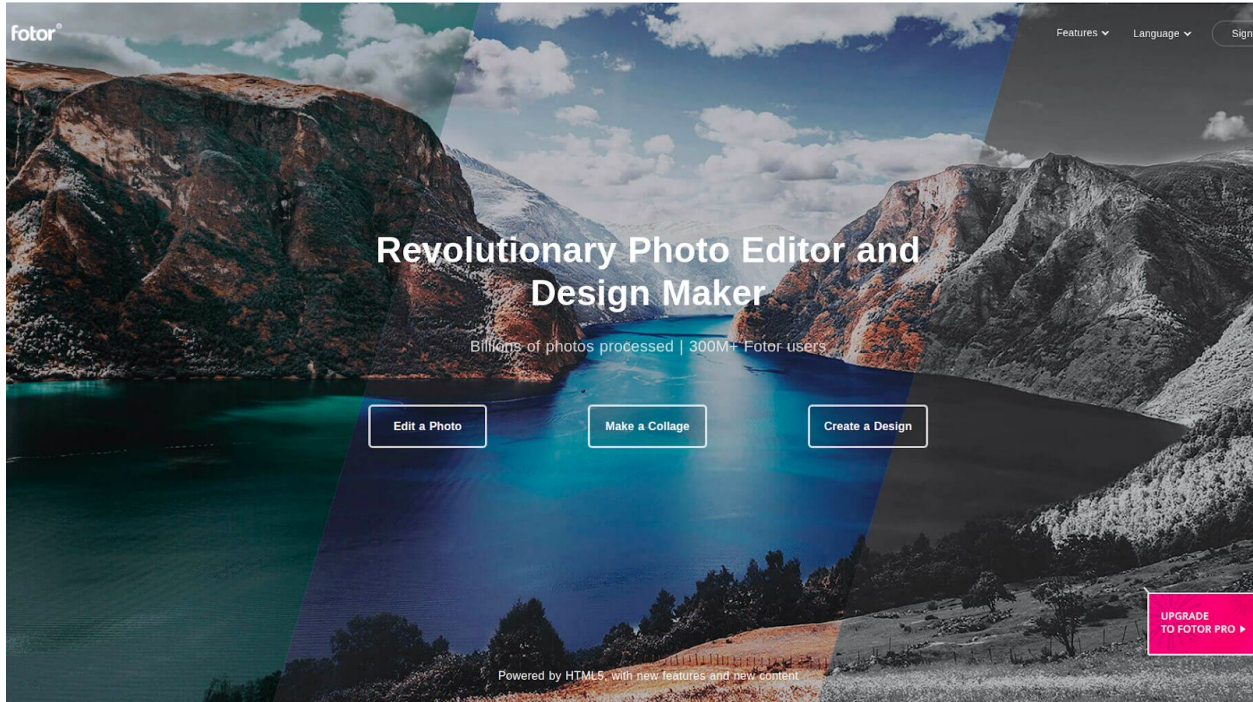

- 1 Examples
- 2 Proceed with editor

This is a great example of a simple layout for the editor for the second layer

Source - <https://www.fotor.com/>

Another example from the same website is shown below

Examples

This page is for those who have never edited an Image before or, are new to our website and need a brief tour of it.

This page will have images of how the editor works and mostly the tools of the editor like what happens when an image is cropped or what happens when the brightness level is increased. As the tools will be discussed in the editor section, this page will contain examples of all those tools.

Navigate

This page will have options to upload an image. It contains the option to add multiple images using various tabs.

Once an image is uploaded, we have three options

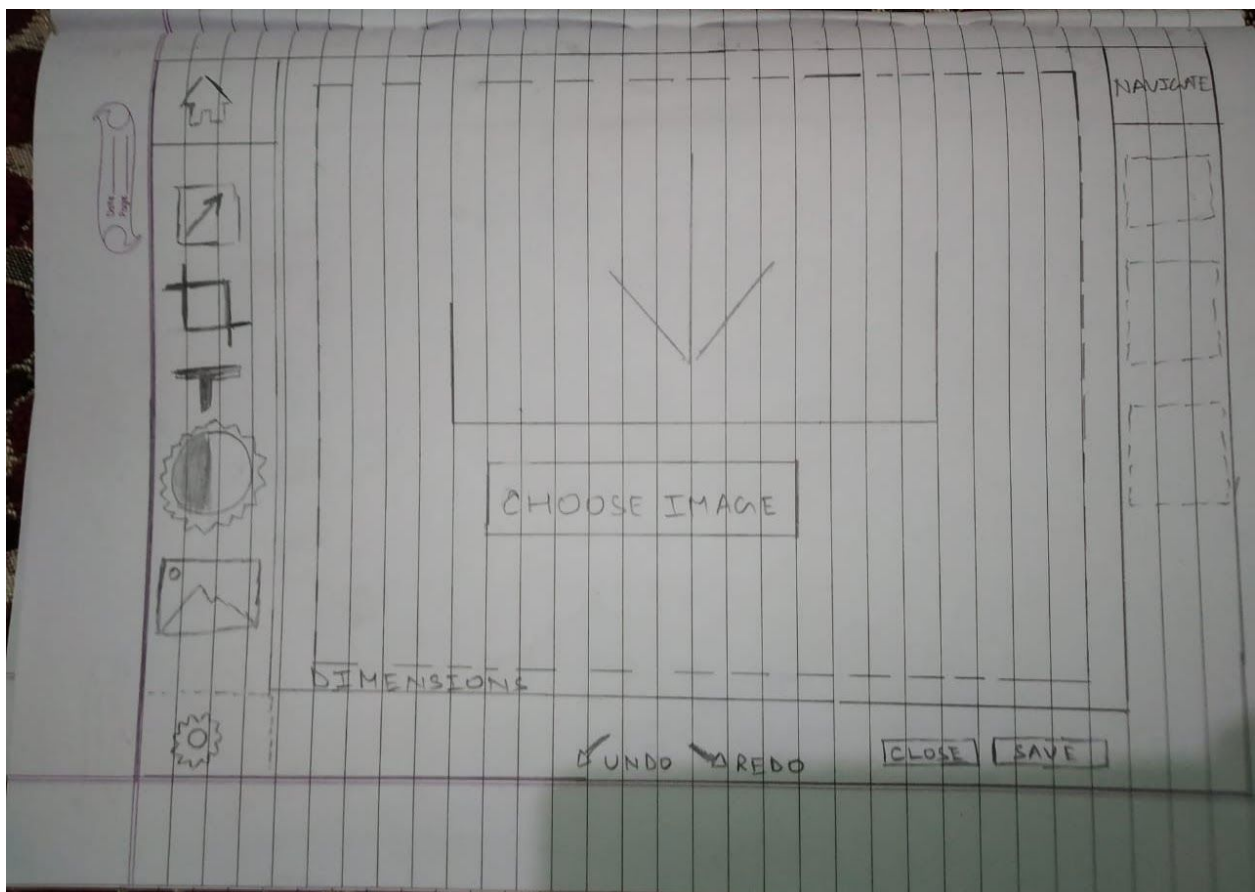

- 1 remove
- 2 re-upload
- 3 proceed with the editor

The remove and re-upload option will remove and re-upload the image again while the proceed with the editor option will take you to the editor. There is one more option which is to delete any given tab.

Once an image is uploaded in one tab, another tab will popup.

The reason to have such an option is that the user can work on multiple images through the convenience of these tabs.

The Editor

Once the image is uploaded on the tab and we proceed with the editor, we will see a new window. This window will have the image in between and all the tools to the right of it. It will also have a home button to the top left corner, to take the user to the home page.

Tools

1 properties

When properties button is clicked, a side panel appears(just like a small sliding window) with various options discussed below

- 1 Rotate left - This will rotate the image 90 degrees to the left.
- 2 Rotate right - This will rotate the image 90 degrees to the right.
- 3 Horizontal and vertical flip - This will rotate the image horizontally or vertically.
- 4 resize image - when clicked a small window will show up with two options, width and height where users have to enter their figures manually. Moreover, there will be two more buttons at the bottom of the small window namely, apply and cancel which would apply the changes to the image or cancel the changes made.
- 5 resize canvas - This will again resize the size of the canvas according to the convenience of the user, the same as the small window discussed above.

2 cutout

This will also have a sliding panel, having the option to cut the image to the desired shape. Shapes include a circle, rectangle, square, etc. Apart from this, the user will have the choice to hold or remove that part of the shape, one reset button to remove all the changes made to the image.

3 adjust

Retaining the same idea of the sliding window, this option will contain features like adjusting the brightness, saturation, and temperature level of the image. This all would be done with the help of a toggle bar so that the user can adjust the level.

In the blur effect, the user selects the part to be blurred with the toggle bar for the desired level.

Crop

A very simple and straightforward tool that helps the user to remove the part of the image that is not needed. This option will allow the user to put the actual height and width of the image so the rest of its part will be removed. Or can select the actual part from the image with the Selection tool. As the selector tool is moved the height and width of the image changes accordingly.

Effects

This option will let the user allow a particular color to dominate the rest of the color. Once a color has been selected, the user will be shown various levels of it using a default image. Now the level cannot be adjusted and so the selection has to be done from within the given options.

Add Image

This feature helps to add images, so as to make a collage. There would be option of various kinds of collage, once one of them is selected, the user can move ahead with adding images by uploading them.

Add elements

This will allow users to select various borders for their image, and add stickers. Borders can have types like dotted, bold, etc. while the stickers can be dragged from the window to the image and can be resized according to the image.
